Cornell Notes	Topic: 2.2 More about functions- Reading	Course: BSc Computer Science
		Class: Discrete Mathematics- Reading
		Date: October 29, 2019
Essential Question:		
What is function composition? Alongside this, what are the floor, ceiling and partial functions ?		
Questions/Cues:		
<ul style="list-style-type: none"><li>• What is function composition?</li><li>• What is the identify function in terms of function composition?</li><li>• What is the graph of a function?</li><li>• What are floor and ceiling functions?</li><li>• What is a partial function?</li></ul>		
Notes		
<ul style="list-style-type: none"><li>• Let <math>g:A \rightarrow B</math> and <math>f:B \rightarrow C</math>, composition of f and g denoted for all <math>a \in A</math> by <math>f \circ g</math> is: <math>(f \circ g)(a) = f(g(a))</math><ul style="list-style-type: none"><li>◦ In this case <math>f \circ g</math> cannot be unless range of g is subset of domain f</li><li>◦ composition of functions not commutative</li></ul></li><li>• Identity function :</li></ul> $(f^{-1} \circ f)(a) = f^{-1}(f(a)) = f^{-1}(b) = a$ $(f \circ f^{-1})(b) = f(f^{-1}(b)) = f(a) = b$ <ul style="list-style-type: none"><li>◦ That is, <math>(f^{-1})^{-1} = f</math></li></ul>		
Let $f$ be a function from the set $A$ to the set $B$ . The <i>graph</i> of the function $f$ is the set of ordered pairs $\{(a, b) \mid a \in A \text{ and } f(a) = b\}$ .		
The <i>floor function</i> assigns to the real number $x$ the largest integer that is less than or equal to $x$ . The value of the floor function at $x$ is denoted by $\lfloor x \rfloor$ . The <i>ceiling function</i> assigns to the real number $x$ the smallest integer that is greater than or equal to $x$ . The value of the ceiling function at $x$ is denoted by $\lceil x \rceil$ .		

- Floor function often also called greatest integer function, denoted by  $\lfloor x \rfloor$

**TABLE 1 Useful Properties of the Floor and Ceiling Functions.**

( $n$  is an integer,  $x$  is a real number)

(1a)  $\lfloor x \rfloor = n$  if and only if  $n \leq x < n + 1$

(1b)  $\lceil x \rceil = n$  if and only if  $n - 1 < x \leq n$

(1c)  $\lfloor x \rfloor = n$  if and only if  $x - 1 < n \leq x$

(1d)  $\lceil x \rceil = n$  if and only if  $x \leq n < x + 1$

(2)  $x - 1 < \lfloor x \rfloor \leq x \leq \lceil x \rceil < x + 1$

(3a)  $\lfloor -x \rfloor = -\lceil x \rceil$

(3b)  $\lceil -x \rceil = -\lfloor x \rfloor$

(4a)  $\lfloor x + n \rfloor = \lfloor x \rfloor + n$

(4b)  $\lceil x + n \rceil = \lceil x \rceil + n$

A *partial function*  $f$  from a set  $A$  to a set  $B$  is an assignment to each element  $a$  in a subset of  $A$ , called the *domain of definition* of  $f$ , of a unique element  $b$  in  $B$ . The sets  $A$  and  $B$  are called the *domain* and *codomain* of  $f$ , respectively. We say that  $f$  is *undefined* for elements in  $A$  that are not in the domain of definition of  $f$ . When the domain of definition of  $f$  equals  $A$ , we say that  $f$  is a *total function*.

- We write  $f: A \rightarrow B$ , denoting  $f$  is partial function from  $A$  to  $B$ , same notation used for functions, context is different; determines whether  $f$  is a partial or total function

**EXAMPLE 32** The function  $f: \mathbf{Z} \rightarrow \mathbf{R}$  where  $f(n) = \sqrt{n}$  is a partial function from  $\mathbf{Z}$  to  $\mathbf{R}$  where the domain of definition is the set of nonnegative integers. Note that  $f$  is undefined for negative integers. ◀

## Summary

In this week, we learned what function composition is and what it means for a function to be partial. Also, we looked at the floor and ceiling functions.
